

CptS 121 - Program Design and Development

touch on grading

Lab 2: More Problem Solving with C

do y'all want more structure
to lab, or progress at your
own?

Assigned: Week of September 4, 2023

Due: At the end of the lab session

I. Learner Objectives:

At the conclusion of this programming assignment, participants should be able to:

- Analyze a basic set of requirements for a problem
- Declare variables
- Apply C data types and associated mathematical operators
- Comment a program according to class standards
- Logically order sequential C statements to solve small problems
- Compose a small C language program
- Compile a C program using Microsoft Visual Studio 2022
- Execute a program
- Create basic test cases for a program

II. Prerequisites:

Before starting this programming assignment, participants should be able to:

- Apply basic problem solving strategies
- Summarize key language elements of C including:
 1. Preprocessor directives
 2. Standard and user-defined identifiers
 3. Comments
 4. Punctuation
 5. Operators

III. Overview & Requirements:

This lab, along with your TA, will help you navigate through problem solving in C.

Labs are held in a “closed” environment such that you may ask your TA questions. Please use your TAs knowledge to your advantage. You are required to move at the pace set forth by your TA. Please help other students in need when you are finished with a task. You must work in teams! Have a great time! Labs are a vital part to your education in CptS 121 so work diligently.

NOTE: you are NOT required to define your own functions for this lab!

Tasks: Design, implement, compile, and test C solutions to the following problems. You should always have at least the following steps in your programs: get the input(s), perform the computation(s), and display the result(s). **Once you have completed a problem, demonstrate your solution to your TA.**

1. Introduce or reintroduce yourself to 3 students in your lab section. This will be your team for today and possibly the rest of the semester! Complete a programming project in chapter 3 of the Hanly & Koffman text. The problem states the following:

Write a program that outputs the equation of the perpendicular bisector of the line segment between two points. Your program should perform the following:

- Prompt the user for the coordinates of the two points
- Compute the slope of the line between those two points
- Compute the coordinates of the midpoint of the line segment between the two points by averaging the two x coordinates and the two y coordinates
- Compute the slope of the perpendicular bisector by taking the negative reciprocal of the slope of the line segment
- Compute the y intercept of the perpendicular bisector (you now have the slope m of the bisector and a point (x_{mid}, y_{mid}) on the bisector, so the y intercept is $y_{mid} - m x_{mid}$)
- Output the labels of the original two points, and output in $y = mx + b$ format the equation of the perpendicular bisector.

Test your program on different pairs of points. Of course, there exist some pairs of points that will make your program not work. You do not have to check programmatically for these points; just consider them.

2. Write a program to calculate your body mass index (BMI). The BMI is a measurement that uses your height and weight to determine if you are underweight, a healthy weight, or overweight. Your program is required to prompt the user for weight in pounds and height in feet. The height must then be converted to inches (recall: 1 foot = 12 inches). Once the BMI has been calculated display the resultant BMI value. Use the equation below to calculate the BMI.

$$\text{BMI} = ((\text{weight in pounds}) / (\text{height in inches})^2) * 703$$

Note: a BMI of less than 18 indicates you are underweight, ≥ 18 and < 25 means you are at a healthy weight, ≥ 25 and < 30 means you are overweight, and > 30 indicates obesity. You do NOT need to classify the BMI value in the program. This would require "if" statements, which you have not learned yet!

3. Work on the current programming assignment.

IV. Submitting Labs:

- You are not required to submit your lab solutions. However, you should keep them in a folder that you may continue to access throughout the semester.

V. Grading Guidelines:

- This lab is worth 10 points. Your lab grade is assigned based on completeness and effort. To receive full credit for the lab you must show up on time, complete at least two-thirds of the problems, and stay until the TA has dismissed you.
